The magnetic disk drive includes a rotating magnetic disk, write and read heads that are suspended by a suspension arm adjacent to a surface of the rotating magnetic disk and an actuator that swings the suspension arm to place the read and write heads over selected circular tracks on the rotating disk. The read and write heads are directly located on a slider that has an air bearing surface (ABS). The suspension arm biases the slider toward the surface of the disk, and when the disk rotates, air adjacent to the surface of the disk moves along with the disk. The slider flies on this moving air at a very low elevation (fly height) on the order of nanometers over the surface of the disk. This fly height is so low that the disk substrate scuffs when the slider rides on the surface of the disk. This is called a slider/disk interface problem. The problem is exacerbated by an increase in surface roughness of the disk substrate resulting from surface roughness of the magnetic media, and from an increase in magnetic media thickness resulting from a higher density of tracks per radial span of the disk. The conventional interface is less than satisfactory due to several consequences. When the disk substrate scuffs as the slider rides on the disk surface, the disk rotational speed must be decreased. Also, a higher amplitude and frequency of disk rotation are required to compensate for the lower velocity. The latter constraint results in peak values of surface velocity on the disk that are greater than desirable. This can degrade the quality of the data as well as decrease the number of tracks that can be written in a given time interval. Although increasing the disk rotational speed can eliminate the problem, this tends to decrease the average or steady state velocity so that the head can lose lift over the disk surface. The life of the slider can be shorter, and if the slider were to separate from the surface of the disk, the slider can crash with the surface of the disk. Consequently, a long term goal has been an ABS that eliminates the slider/disk interface problem. Another consideration is that 3e33713323
