The Main Menu is very easy to use and is very similar to WindowsÂ .The present invention is directed to a construction and assembly method for connection between different panels that allows a user to easily and quickly create and connect an assembly. More specifically, the invention is directed to a construction and assembly method for connection between a door and window that allows for a quick connection and adjustment between the components. The invention is also directed to a connection that includes an adjustment device. As described in the above-cited applications, panels are frequently configured to attach one inside another to create an enclosed volume for a variety of applications. In some cases, the panels are permanently and immovably attached together, such as through the use of welds or adhesives. In other cases, the panels are attached via fasteners such as screws. Although such an assembly method is generally satisfactory, it is often difficult to manufacture a quick connection without sacrificing quality and/or precision.

1. Field of the Invention The present invention relates generally to electronic packaging and more specifically to circuits and methods for selective connection of integrated circuit (IC) packages to a substrate. 2. Background of the Invention Modern electrical and electronic systems often include multiple integrated circuit (IC) packages, substrates, and/or PCBs. The IC packages can be arranged on substrates or PCBs. An IC package can include a number of different parts, such as a substrate, a number of pins or contacts, a die (or chip), and a package cover. The IC package can include contacts, such as solder balls, on the exterior of the package. A substrate can include internal contacts that are arranged, and through which signals can be provided to or from the pins on the IC package. An IC package can be coupled to a substrate by connecting one of the pins to a corresponding internal contact, for example, by soldering. In some cases, IC packages are intended to be connected to a PCB by connecting one of the pins to a corresponding via on the PCB. When multiple IC packages are connected to a substrate or PCB, a first IC package can be electrically connected to a 3e33713323
